The EV-N-Spread Broadcast Spreader, also referred to as a rotary spreader, is manufactured by Earthway and is the best in our tests. It has a nylon bag container and precision gears to broadcast seed or fertilizer across an area to be covered. The spreader holds up to 20 pounds of seed and has a 30-foot spread width. The hopper's nylon is mounted on a molded plastic base with a metal crank and corrosion-resistant gears. The unit includes a shoulder strap for easy handling.

Additional features:

- Oscillating shuttle prevents clumping.
- Flow control has infinite settings.
- Zippered nylon bag and comfortable shoulder straps.
- Unique standing leg holds spreader upright while filling.
- Precision shuttle system ensures exceptionally smooth broadcast.

Spraying a dry lubricant, such as silicone, on all the bearings on the under side will extent the life of your spreader. Do not use oil or grease; these will cause gum-up and prevent your spreader from operating easily. It is important to wash and dry your spreader after each use.
