Hoop Loops Installation Manual

7030 E 46th Avenue Dr, Denver, CO 80216, United States
support@hensleyseeds.com | hensleyseeds.com

Hoop loops are ideal for supporting one or multiple layers of row cover for low tunnels in protected culture. The loops twisted into each hoop allows for string to be stretched the entire length of the row without having to tie any knots, making installation and removal quicker. Each hoop is made of #6 galvanized steel. the source supplier offers three different hoop widths to accommodate varying bed widths.

INSTALLATION:

Place Hoop Loops every 10 feet in the row, pushing them as deep into the ground as you can while still leaving enough room for the crops to grow without touching the row cover above them. Drive stakes into the ground at each end of the row and tie your twine to one of them. Walk down the bed and feed your twine through all the loops on one side, when you reach the end pull tight and wrap the twine several times around the stake Start back down the other side of the bed while feeding the twine through the remaining loops and finish by pulling tight and tying off to the stake where you started.
