Please Read Before Storing Compostable Trellis Clips.

These clips are made from plant starches that have a lower melting point than traditional plastic trellis clips. When the clips are stored in their clear plastic bag in direct sunlight and high temperatures, the bag will experience a greenhouse effect, subjecting the clips to conditions that can exceed their melting point. Source trials tested the clips and found their melting point to be about 150°F/65°C. Melting has not been observed when the clips are in use on the vine. Temperatures would likely not get that high under normal growing conditions because it would be detrimental and likely fatal to the plants.

Compostable Trellis Clips were evaluated in the source product line, with staff reporting they were very pleased with their performance at the research site in USDA zone 5b. We recommend that you store the clips in a cool, dry, and shaded location — not in direct sun in the greenhouse.
